## ON SEMI-II-PROPERTY OF SUBGROUPS OF FINITE GROUP

A. LIU AND B. LI\*

(Communicated by Ali Reza Ashrafi)

**ABSTRACT.** Let  $G$  be a group and  $H$  a subgroup of  $G$ . Then  $H$  is said to have semi-II-property in  $G$  if there is a subgroup  $T$  of  $G$  such that  $G = HT$  and  $H \cap T$  has II-property in  $T$ . In this paper, investigating on semi-II-property of subgroups, we shall obtain some new description of finite groups.

**Keywords:** Finite group, semi-II-property, SE subgroup,  $p$ -nilpotent.

**MSC(2010):** Primary: 20D10; Secondary: 20D20.

### 1. Introduction

Throughout this paper, all groups are finite. We use standard terminology, as in Huppert [7] or Guo [5].  $G$  always is a group, and  $|G|$  is the order of  $G$ ;  $\pi(G)$  denotes the set of all primes dividing  $|G|$ . Also  $\mathbb{P}$  is the set of all primes and  $\pi$  denotes a subset of  $\mathbb{P}$ ;  $\pi'$  is the complement of  $\pi$  in  $\mathbb{P}$ . A group  $G$  is said to be a  $\pi$ -group if  $\pi(G)$  is a subset of  $\pi$ .

Subgroups play a very important role in group theory and different properties of subgroups have been studied by mathematicians, such as normality, quasinormality [10], S-quasinormality (cf. [3], etc), C-normality [14], weakly  $s$ -permutability [12],  $s$ -embedded and  $n$ -embedded property [6] and cover-avoidance property (cf. [4, A(10.8)]). A property of subgroups was proposed as the following in [8], to uniform some recent results.

**Definition 1.1.** Let  $H$  be a subgroup of  $G$ .  $H$  is said to have II-property in  $G$  if for any  $G$ -chief factor  $L/K$ ,  $|G/K : N_{G/K}(HK/K \cap L/K)|$  is a  $\pi$  ( $HK/K \cap L/K$ )-number.

Li proved in [8] that there are many examples of embedding properties of subgroups implying the possession of the II-property. After the work in [8],

some new research has been done by many mathematicians (cf. [2, 13], etc). Let  $H$  and  $T$  be two subgroups of  $G$ . Recall that  $T$  is called a supplement of  $H$  in  $G$  if  $G=HT$ , and if furthermore  $H \cap T=1$ , then  $T$  is said to be a complement of  $H$  in  $G$ . To develop the work of  $\Pi$ -property of subgroups, we introduce the following new concept in this paper.

**Definition 1.2.** Let  $H$  be a subgroup of  $G$ . Then  $H$  is said to have semi- $\Pi$ -property in  $G$ , if there is a subgroup  $T$  of  $G$  such that  $G = HT$  and  $H \cap T$  has  $\Pi$ -property in  $T$ .

*Remark 1.3.* (1) If  $H$  is a complement, then  $H$  has semi- $\Pi$ -property in  $G$  (cf. Lemma 2.2 in Section 2).

(2) It is clear that if  $H$  has  $\Pi$ -property in  $G$  then  $H$  has semi- $\Pi$ -property, but the reverse is not true. For example, the Sylow 5-subgroups of  $A_5$  are complement in  $A_5$  and hence have semi- $\Pi$ -property in  $A_5$ , but there is no non-trivial subgroup of  $A_5$  with  $\Pi$ -property.

(3) If  $H$  has a supersolvable supplement in  $G$ , then  $H$  has semi- $\Pi$ -property in  $G$  (cf. Lemma 2.2 in Section 2).

(4) In [8], if  $HT = G$  and  $H \cap T \leq I \leq H$ , where  $I$  is a subgroup having  $\Pi$ -property in  $G$ , then  $H$  is called  $\Pi$ -supplemented in  $G$ . The following example shows that a subgroup  $H$  satisfying semi- $\Pi$ -property in  $G$  can not be  $\Pi$ -supplemented in  $G$ .

*Example 1.4.* Let  $X = \langle x \rangle \times \langle y \rangle$ , where  $|x| = |y| = 25$ . The maps  $\alpha : x \mapsto x^7, y \mapsto y^{-7}$  and  $\beta : x \mapsto y^{-1}, y \mapsto x$  are automorphisms of  $X$  and generate a subgroup  $A \leq \text{Aut}(X)$  of order 8 ( $A$  is isomorphic with the quaternion group). Let  $G = [X]A$ . Then the subgroup  $H = \langle x^5, \alpha \rangle$  has a supplement  $T = \langle X, \beta \rangle$  in  $G$ . Since  $T$  is supersolvable,  $H$  has semi- $\Pi$ -property in  $G$ . On the other hand, since  $x^5$  belongs to  $\Phi(X)$  and  $X$  is the normal Sylow 5-subgroup of  $G$  and  $x^5 \in T$  for any supplement  $T$  of  $H$  in  $G$ . That is  $\langle x^5 \rangle \leq H \cap T \leq H$ . But neither  $\langle x^5 \rangle$  nor  $H$  has the  $\Pi$ -property in  $G$ , so  $H$  is not a  $\Pi$ -supplement in  $G$ .

Recall that a normal subgroup  $H$  of  $G$  is said to be SE in  $G$  if every chief factor of  $G$  lying in  $H$  is cyclic, and, there is a unique maximal SE subgroup of  $G$ , which is denoted by  $\text{SE}(G)$ . It is (cf. [15, 1.7]). Similarly, we call that a normal subgroup  $H$  of  $G$  is  $\text{SE}_p$  in  $G$  if every  $p$ -chief factor of  $G$  which lies in  $H$  is cyclic. The unique maximal  $\text{SE}_p$  subgroup of  $G$  is denoted by  $\text{SE}_p(G)$ . If  $G \neq 1$  is  $p$ -solvable, then  $G$  has a nontrivial  $p$ -nilpotent normal subgroup. The product of all  $p$ -nilpotent normal subgroup of  $G$  is denoted by  $F_p(G)$ . A group  $G$  is said quasinilpotent if all of its elements induce an inner automorphism on each chief factor of  $G$ . In a group  $G$ , the product of all quasinilpotent normal subgroups is called the generalized Fitting subgroup of  $G$  is denoted by  $F^*(G)$ .

Based on the concept of semi- $\Pi$ -property, we shall mainly prove the following theorems.

*Theorem A.* Let  $E$  be a  $p$ -solvable normal subgroup of  $G$  and  $P$  a Sylow  $p$ -subgroup of  $F_p(E)$ . Then  $E \leq \text{SE}_p(G)$  if and only if every cyclic subgroup of  $P$  of order  $p$  or 4 (if  $P$  is a non-abelian 2-group) has semi- $\Pi$ -property in  $G$ .

**Theorem 1.5** (Theorem B). *Let  $E$  be a normal subgroup of  $G$ . Then  $E \leq \text{SE}(G)$  if and only if every cyclic subgroup of  $F^*(E)$  of prime order or of order 4 (if the Sylow 2-subgroup is non-abelian) has semi- $\Pi$ -property in  $G$ .*

## 2. Preliminaries

**Lemma 2.1.** *Let  $H$  be a subgroup of  $G$  and  $N$  a normal subgroup of  $G$ .*

- (1) *If  $H \leq T \leq G$  and  $H$  has  $\Pi$ -property in  $T$ , then  $HN/N$  has  $\Pi$ -property in  $TN/N$ .*
- (2) *If  $H$  has  $\Pi$ -property in  $G$ , then  $H$  has semi- $\Pi$ -property in  $G$ .*
- (3) *If  $H$  has semi- $\Pi$ -property in  $G$ , then  $HN/N$  has semi- $\Pi$ -property in  $G/N$  when  $H \subseteq N$  or  $(|H|, |N|) = 1$ .*

*Proof.* (1) Since  $H$  has  $\Pi$ -property in  $T$ , hence by [8, Proposition 2(1)]  $H(T \cap N)/(T \cap N)$  has  $\Pi$ -property in  $T/T \cap N$ . On the other hand, by using the isomorphism

$$\begin{aligned} \sigma : T/T \cap N &\longrightarrow TN/N \\ t(T \cap N) &\longmapsto tN \end{aligned}$$

we may replace  $H(T \cap N)/(T \cap N)$  by  $HN/N$ . So  $HN/N$  has  $\Pi$ -property in  $TN/N$ .

(2) It is obvious by choosing  $T = G$

(3) Suppose that  $H$  has semi- $\Pi$ -property in  $G$ , then there is a subgroup  $T$  of  $G$  such that  $G = HT$  and  $H \cap T$  has  $\Pi$ -property in  $T$ . If  $N \subseteq H$ , then  $(H/N) \cap (TN/N) = (H \cap T)N/N$ , and  $(H \cap T)N/N$  has  $\Pi$ -property in  $TN/N$  by (1). Thus  $H/N$  has semi- $\Pi$ -property in  $G/N$ . If  $(|H|, |N|) = 1$ , then  $N \subseteq T$  since  $N$  is normal in  $G$ . Similarly as above, we have  $H/N$  has semi- $\Pi$ -property in  $G/N$ . □

**Lemma 2.2.** *Let  $H$  be a subgroup of  $G$ . Then  $H$  has semi- $\Pi$ -property in  $G$  if one of the following holds:*

- (1)  *$H$  is complement in  $G$ ;*
- (2)  *$H$  has a supersolvable supplement in  $G$ .*

*Proof.* (1) Assume that  $T$  is a complement of  $H$  in  $G$ . Then,  $H \cap T = 1$  has  $\Pi$ -property in  $T$  and hence  $H$  has semi- $\Pi$ -property in  $G$ .

(2) Assume that  $T$  is supersolvable and  $G = HT$ . Then every subgroup of  $T$  has  $\Pi$ -property in  $T$  by [8, Proposition 2.11]. In particular,  $H \cap T$  has  $\Pi$ -property in  $T$  and therefore,  $H$  has semi- $\Pi$ -property in  $G$ . □

**Lemma 2.3.** ([8, Proposition 2.9]) *Let  $H$  be a  $p$ -subgroup of  $G$  for some prime divisor  $p$  of  $|G|$ , and assume that  $H$  has  $\Pi$ -property in  $G$ . Then any  $G$ -chief factor  $L/K$  which does not avoid  $H$  is a  $p$ -factor and hence is abelian.*

**Lemma 2.4.** ([8, Proposition 2.7]) *Let  $H$  be a  $p$ -group of  $G$  and  $N$  a minimal normal subgroup of  $G$ . Assume that  $H$  has  $\Pi$ -property in  $G$ . If there is a Sylow  $p$ -subgroup  $G_p$  of  $G$  such that  $H \leq G_p$ , then  $H \cap N = N$  or  $1$ .*

**Lemma 2.5.** *Let  $N$  be a normal subgroup of order  $p$  in  $G$  and  $a \in G$  is an element of order  $p$ . If  $H = \langle N, a \rangle$  has  $\Pi$ -property in  $G$  then so does  $A = \langle a \rangle$ .*

*Proof.* Let  $L/K$  be an arbitrary chief factor of  $G$ . By the definition, we only need to prove that  $|G/K : N_{G/K}((A \cap L)K/K)|$  is a  $p$ -number. If  $A \leq K$ , then it is clear. Assume that  $A \not\leq K$ . By [8, Proposition 2.1 (1)],  $HN/N$  has  $\Pi$ -property in  $G/N$ . If  $N \leq K$  then  $H \subseteq AK$  and so,  $(A \cap L)K = (H \cap L)K$ . It follows that  $|G/K : N_{G/K}((A \cap L)K/K)| = |G/K : N_{G/K}((H \cap L)K/K)|$  is a  $p$ -number since  $H$  has  $\Pi$ -property in  $G$ . If  $N \not\leq K$ , then the hypotheses still hold for  $G/K$ . By induction, if  $K \neq 1$ , then  $AK/K$  has  $\Pi$ -property in  $G/K$ . This induces that  $|G/K : N_{G/K}((A \cap L)K/K)|$  is a  $p$ -number. Assume that  $K = 1$  and hence  $L$  is a minimal normal subgroup of  $G$ . Since  $N$  is also minimal normal in  $G$ , we see that  $L = N$  or  $L \cap N = 1$ . If  $L = N$ , then  $A \cap L = 1$  or  $A = N$  and thus  $|G : N_G(A \cap L)| = 1$ . Assume that  $L \cap N = 1$ . Since  $H$  has order  $p^2$ ,  $H \cap L = 1$  or cyclic of order  $p$ . On the other hand, since  $A$  is cyclic of order  $p$ ,  $A \cap L = 1$  or is cyclic of order  $p$ , too. If  $A \cap L = 1$ , then  $|G : N_G(A \cap L)| = 1$ . If  $A \cap L$  is of order  $p$ , we should have  $A \cap L = H \cap L$  and hence  $|G : N_G(A \cap L)| = |G : N_G(H \cap L)|$  is a  $p$ -number. This shows that the lemma holds.  $\square$

**Lemma 2.6.** ([9, Lemma 2.7]) *Let  $P$  be a Sylow  $p$ -subgroup of  $G$  and  $N$  a normal subgroup of  $G$  with  $G = NP$ . Assume that  $N_G(P)$  is  $p$ -nilpotent and all subgroups of order  $p$  in  $N$  are complemented in  $G$ . Then  $G$  is  $p$ -nilpotent.*

### 3. Proofs of Theorems A and B

**Lemma 3.1.** *Let  $P$  be a normal  $p$ -subgroup of  $G$ . If every cyclic subgroup of  $P$  of order  $p$  or  $4$  (if  $P$  is a non-abelian  $2$ -group) has semi- $\Pi$ -property in  $G$  then  $P \leq SE(G)$ .*

*Proof.* Assume that this lemma does not hold. Then there is a  $G$ -chief factor in  $P$  which is not of prime order. Choose a  $G$ -chief factor  $L/K$  in  $P$  such that  $|L/K|$  is not prime but  $|U/V|$  is prime for any chief factor  $U/V$  of  $G$  in  $P$  with  $|U| < |L|$ .

Let  $W = \bigcap_{U \subseteq K} C_G(U/V)$ , where  $U/V$  is a  $G$ -chief factor. Then, by [4, A(12.3)], all elements in  $W$  of  $p'$ -order act trivially on  $K$ . Let  $C = C_G(K)$  and assume  $L \not\subseteq C$ . If  $L \subseteq KC$ , then  $(L \cap C)/(K \cap C) \cong L/K$  is chief factor of  $G$ . By the choice of  $L/K$ ,  $|L/K| = |(L \cap C)/(K \cap C)|$  is prime, a contradiction. If

$L \not\subseteq KC$ , then it is easy to see that  $LC/K = L/K \times KC/K$ , and thereby all  $p'$ -elements in  $C$  act trivially on  $L/K$ . It follows that all  $p'$ -elements in  $W$  act trivially on  $L/K$ . Hence  $W \subseteq C_G(L/K)$ . Since  $G/W = G/\bigcap_{U \subseteq K} C_G(U/V)$  is an abelian group of exponent dividing  $p-1$  and  $W \subseteq C_G(L/K)$ ,  $G/C_G(L/K)$  is an prime order by [15, I, Lemma 1.3], a contradiction.

Now assume  $L \subseteq C$ . Then  $K \subseteq Z(L)$ . Let  $a, b$  be elements of order  $p$  in  $L$ . Suppose  $p > 2$  or  $P$  is abelian. Then  $(ab)^p = a^p b^p [b, a]^{\frac{p(p-1)}{2}} = 1$ . Hence the product of elements of order  $p$  is of order  $p$  or 1 and hence  $\Omega = \{a \in L \mid a^p = 1\}$  is a subgroup of  $L$ . If  $\Omega \subseteq K$ , then all elements of  $W$  with  $p'$ -order act trivially on all elements of  $L$  with order  $p$  since they act trivially on  $K$ . It follows from [7, IV, Satz 5.12] that all elements in  $W$  of order  $p'$  act trivially on  $L$ . Thus  $W \subseteq C_G(L/K)$  and, as above argument,  $L/K$  is of prime order, a contradiction. If  $\Omega \not\subseteq K$ , then  $L = \Omega K$ . Choose an element  $a$  in  $\Omega \setminus K$  such that  $\langle a \rangle K/K \subseteq L/K \cap Z(G_p/K)$ . Let  $H = \langle a \rangle$ . Then  $H$  has semi- $\Pi$ -property in  $G$  and so there is a subgroup  $T$  of  $G$  such that  $G = HT$  and  $H \cap T$  has  $\Pi$ -property in  $T$ . If  $T = G$ , then  $H \cap T = H$  has  $\Pi$ -property in  $T = G$ . By Lemma 2.1 (1),  $HK/K$  has  $\Pi$ -property in  $G/K$ . It follows from Lemma 2.4 that  $L/K = HK/K \cap L/K = HK/K$  is cyclic, a contradiction. Assume that  $T < G$ . Clearly,  $T$  is maximal in  $G$ . If  $K \not\subseteq T_G$ , then  $KT_G/T_G$  is nontrivial. By Bare's Theorem (cf. [4, A(15.2)]),  $G/T_G$  has a unique minimal normal subgroup  $R/T_G$  which is contained in  $KT_G/T_G$  and is self centralized. Clearly  $R/T_G \leq KT_G/T_G \leq LT_G/T_G$ . Since  $R/T_G \leq Z(LT_G/T_G)$  by the property of  $p$ -group,  $KT_G = LT_G$ . It follows that  $\frac{|K|}{|K \cap T_G|} = \frac{|L|}{|L \cap T_G|}$  and hence  $|L/K| = |(L \cap T_G)/(K \cap T_G)|$ . Since  $K \not\subseteq T_G$ ,  $L \not\subseteq T_G$  and so,  $|L \cap T_G| < |L|$ . By the choice of  $L/K$ ,  $(L \cap T_G)/(K \cap T_G)$  is of order  $p$  and so is  $L/K$ , a contradiction. Assume that  $K \leq T_G \leq T$ . Then  $T/K$  is maximal in  $G/K$  and  $G/K = (\langle a \rangle K/K)(T/K) = (L/K)(T/K)$ . It follows that  $T/K$  is a complement of  $L/K$  in  $G/K$  and  $|L/K| = |G/K : T/K| = |G : T| = |x| = p$ . Thus  $L/K$  is cyclic. It can be proved that  $L/K$  is cyclic similarly when  $p = 2$  and  $P$  is a non abelian 2-group. This contradiction shows  $P \leq SE(G)$  and the lemma holds.  $\square$

*Proof of Theorem A.* The “if” part: assume that  $O_{p'}(E) \neq 1$ . Then  $F_p(E/O_{p'}(E)) = F_p(E)/O_{p'}(E)$ . By Lemma 2.1, the hypotheses still hold on  $E/O_{p'}(E)$ . Then, by induction on  $|E|$ ,  $E/O_{p'}(E) \leq SE_p(G/O_{p'}(E))$  and hence every  $pd$ - $G$ -chief factor which lies in  $E$  is cyclic, that is  $E \leq SE_p(G)$ .

Assume that  $O_{p'}(E) = 1$ . Then  $F_p(E) = F(E) = O_p(E)$  is a  $p$ -group. By Lemma 3.1,  $F(E) \leq SE(G)$ . Let  $M_i/N_i$ ,  $i = 1, \dots, n$ , be all  $G$ -chief factor in  $F(E)$  and  $C = \bigcap_{i=1}^n C_G(M_i/N_i)$ . Then  $F(E) \leq C$ . We claim that  $F(E) = C$ . Otherwise, let  $R/F(E)$  be a  $G$ -chief factor with  $R \leq C$ . Since  $E$  is  $p$ -solvable,  $R/F(E)$  is a  $p$ -factor or  $p'$ -factor. In particular,  $R/F(E)$  is  $p$ -nilpotent. But  $R \leq C$ , so  $R$  is  $p$ -nilpotent and hence  $R \leq F_p(E) = F(E)$ , a contradiction.

Thus our claim holds and  $F(E) = C$ . If  $E \not\leq \text{SE}_p(G)$ , then there is a  $G$ -chief factor  $L/K$  in  $E$  such that  $L/K$  is noncyclic, but any  $G$ -chief factor  $U/V$  in  $E$  with  $|V| < |K|$  is cyclic. Let  $M/N$  be an arbitrary  $G$ -chief factor lying in  $F(E)$  and put  $C_1 = C_E(M/N)$ . Since  $M/N$  is of prime order,  $E/C_1$  is cyclic and hence  $L/L \cap C_1 \cong LC_1/C_1 \leq E/C_1$  is cyclic. It follows that  $L \cap C_1 \not\leq K$  and so  $L = (L \cap C_1)K$ . Therefore,  $L/K = (L \cap C_1)K/K \cong L \cap C_1/K \cap C_1$  is a  $G$ -chief factor. By the choice of  $K$ , we have  $K \leq C_1$  and so  $L = K(L \cap C_1) = L \cap KC_1 = L \cap C_1$ . This induces that  $L \leq C_1$  and consequently  $L \leq C_E(M/N)$  for any  $G$ -chief factor  $M/N$  of  $F(E)$ . Thus  $L \leq C = F(E)$ , a contradiction and hence  $E \leq \text{SE}_p(G)$ .

The “only if” part: we shall prove that every  $p$ -subgroup of  $E$  has  $\Pi$ -property in  $G$  and hence the “only if” part holds. To prove this, by [8, Proposition 2.3], we only need to prove that every  $p$ -subgroup of  $E$  is a CAP-subgroup of  $G$ .

Let  $H$  be a  $p$ -subgroup of  $E$  and  $L/K$  be a  $G$ -chief factor. Since  $E$  is normal in  $G$ ,  $E$  covers or avoids  $L/K$ . If  $E$  avoids  $L/K$  then so does  $H$  since  $H \leq E$ . Assume that  $E$  covers  $L/K$ . Then  $L \leq KE$  and hence  $L = L \cap KE = (L \cap E)K$ . It follows that  $L/K = (L \cap E)K/K \cong (L \cap E)/(K \cap E) \leq E/(K \cap E)$ . Since  $E \leq \text{SE}_p(G)$ ,  $L/K$  is either of  $p'$ -order or of order  $p$ . If  $L/K$  is of  $p'$ -order, then clearly,  $H$  avoids  $L/K$ . If  $L/K$  is of order  $p$ . Then  $(H \cap L)K/K = L/K$  or 1. If  $(H \cap L)K/K = L/K$  then  $L = (H \cap L)K = L \cap HK$  and hence  $H$  covers  $L/K$ . If  $(H \cap L)K/K = 1$  then  $H \cap L \leq K$  and hence  $H$  avoids  $L/K$ . This means that  $H$  is a CAP-subgroup of  $G$  and hence the theorem holds.  $\square$

**Proof of Theorem B.** The “only if” part can be proved similarly to Theorem A and we only prove the “if” part.

We claim that  $F^*(E)$  is solvable. Let  $H$  be a subgroup of  $F^*(E)$  with order 2 and let  $T$  be a supplement of  $H$  in  $G$ . If  $H \cap T = 1$  then  $|G : T| = 2$  and hence  $T \trianglelefteq G$ . It follows that  $F^*(E) \cap T \trianglelefteq G$  and  $F^*(E) \cap T < F^*(E) \leq E$ . Clearly, the hypotheses still hold for  $(G, F^*(E) \cap T)$  and, by induction on  $|E|$ , we have that  $F^*(E) \cap T \leq \text{SE}(G)$ . In particular,  $T \cap F^*(E)$  is solvable. Since  $F^*(E)/F^*(E) \cap T$  is of order 2,  $F^*(E)$  is solvable. Assume that  $H \cap T = H$  for any supplement  $T$ , then  $H$  has  $\Pi$ -property in  $G$  by the hypotheses. If the Sylow 2-subgroup of  $F^*(E)$  is abelian. Then  $F^*(E)$  is 2-nilpotent and hence is solvable by [8, Lemma 3.2]. Assume that the Sylow 2-subgroup of  $F^*(E)$  is nonabelian. If  $F^*(E)$  is a  $2'$ -group, then it is solvable. Assume that  $F^*(E)$  is not a  $2'$ -group. Then  $O_{2'}(F^*(E)) < F^*(E)$ . Let  $R/O_{2'}(F^*(E))$  be a  $G$ -chief factor in  $F^*(E)$ . Then  $|R|$  is even and  $R$  has a subgroup  $H$  of order 2. By above argument,  $H$  has  $\Pi$ -property in  $G$ . Clearly,  $H$  does not avoid  $R/O_{2'}(F^*(E))$ . By Lemma 2.3,  $R/O_{2'}(F^*(E))$  is a 2-group and so  $R$  is solvable. Since  $R \leq F^*(E)$  is quasinilpotent,  $R$  is nilpotent and hence  $O_2(R) \neq 1$ . It follows that  $O_2(E) \neq 1$  and by Lemma 3.1,  $O_2(E) \leq \text{SE}(G)$ . Thus, every  $G$ -chief factor in  $O_2(E)$  is cyclic. Therefore,  $O_2(E) \leq Z_\infty(G)$ . Let  $X/F(E)$  be a  $G$ -chief factor in  $F^*(E)$ . If  $X$  is solvable, then  $X$  is nilpotent since  $X \leq F^*(E)$ , a contradiction.

Thus  $X$  and so  $X/F(E)$  is not solvable. Since  $X$  is not solvable, there is a minimal non-2-nilpotent subgroup  $M$  in  $X$ . By the structure of a minimal non- $p$ -nilpotent group,  $M = A \rtimes B$ , where  $A$  is a 2-group of exponent 2 or 4 (when  $A$  is nonabelian 2-group) and  $B$  is a  $p'$ -group. If all elements of  $X$  of order 2 and 4 are in  $O_2(E)$ , then all such elements are in  $O_2(E) \leq Z_\infty(G)$ . Thus  $A \leq Z_\infty(G)$ . It follows that  $A \leq M \cap Z_\infty(G) \leq Z_\infty(M)$  and so  $M$  is nilpotent, a contradiction. Hence there must be some element  $x$  of order 2 or 4 such that  $x \in X$  and  $x \notin O_2(E)$ . Furthermore, we can choose that  $x^2 \in O_2(E)$ . By the hypotheses,  $H = \langle x \rangle$  has semi-II-property in  $G$ . Let  $T$  be a supplement of  $H$  in  $G$ . Assume  $T < G$ . If  $O_2(E) \leq T$ , then  $|G : T| = 2$  since  $x^2 \in O_2(E) \leq T$  and  $HT = G$ . Thus  $T \trianglelefteq G$ . By a similar argument as above,  $F^*(E)$  is solvable. If  $O_2(E) \not\leq T$ , then there must be a subgroup  $D$  of  $O_2(E)$  such that  $DT$  is a subgroup of  $G$  and  $|G : DT| = 2$  since  $O_2(E) \leq Z_\infty(G)$  and  $|G : T| = 2$  or 4. Then  $DT \trianglelefteq G$  and similarly as above,  $F^*(E)$  is solvable. Finally, assume that  $G$  is the only supplement of  $H$  in  $G$ . Then  $H$  has II-property in  $G$ . By Lemma 2.3,  $X/F(E)$  is abelian, a contradiction. This contradiction shows that  $F^*(E)$  is solvable and our claim holds.

Now, let  $F^*(E) = F(E)$  be the direct product of primary subgroups. By Lemma 3.1,  $F^*(E) \leq \text{SE}(G)$ . Similar to the proof of Theorem A,  $E \leq \text{SE}(G)$  and the theorem holds.  $\square$

#### 4. On $p$ -nilpotency of groups

**Theorem 4.1.** *Let  $G$  be a group and  $p$  a prime with  $(|G|, p-1) = 1$ . Assume that  $E$  is a normal subgroup of  $G$  with  $p$ -nilpotent quotient. Let  $P$  be a Sylow  $p$ -subgroup of  $E$ . If every subgroup of  $P$  of order  $p$  or 4 (if  $P$  is a nonabelian 2-group) has semi-II-property in  $G$ , then  $G$  is  $p$ -nilpotent.*

*Proof.* By a similar argument as in the proof of Theorem B, we can obtain that  $E$  is solvable. Then, it follows from Theorem A that  $E \leq \text{SE}_p(G)$ . Thus every  $pd$ -chief factor  $H/K$  of  $G$  in  $E$  is cyclic of order  $p$ . Since  $G/C_G(H/K)$  is isomorphic to some subgroup of  $\text{Aut}(H/K)$ , which is cyclic of order  $p-1$ , and  $(|G|, p-1) = 1$ , we see that  $G/C_G(H/K) = 1$  and  $H/K$  is central, that is, every  $G$ -chief factor in  $E$  is either of  $p'$ -order or central in  $G$ . Since  $G/E$  is  $p$ -nilpotent, we obtain that  $G$  is also  $p$ -nilpotent.  $\square$

It is easy to show that if  $(|G|, p^2-1) = 1$ , then  $G$  has no chief factor of order  $p^2$  and so if  $p^3 \nmid |G|$  then  $G$  is  $p$ -nilpotent. A more general result can be found in [1, Lemma 2.12]. Considering groups in which every subgroup of order  $p^2$  has semi-II-property, we obtain the following theorem.

**Theorem 4.2.** *Let  $G$  be a group and  $p$  a prime with  $(|G|, p^2-1) = 1$ . Assume that  $E$  is a normal subgroup of  $G$  with  $p$ -nilpotent quotient. Let  $P$  be a Sylow*

$p$ -subgroup of  $E$ . If every subgroup of  $P$  of order  $p^2$  has semi- $\Pi$ -property in  $G$ , then  $G$  is  $p$ -nilpotent.

*Proof.* Assume that theorem is not true, and  $G$  is a counterexample of minimal order. We prove the theorem via the following steps:

(1)  $O_{p'}(G) = 1$ .

By Lemma 2.1, the hypotheses still hold on  $G/O_{p'}(G)$ . If  $O_{p'}(G) \neq 1$ , then we can assume that  $G/O_{p'}(G)$  is  $p$ -nilpotent by the choice of  $G$ . It follows that  $G$  is  $p$ -nilpotent, a contradiction. Hence  $O_{p'}(G) = 1$ .

(2) Let  $N$  be a minimal normal subgroup of  $G$ . If  $N \leq O_p(G)$ , then  $N$  is cyclic of order  $p$ .

Since  $N \leq O_p(G)$ ,  $N$  is a  $p$ -group. If  $N \not\subseteq E$ , then  $NE/E$  is a chief factor of  $G/E$ . But  $G/E$  is  $p$ -nilpotent, so  $N \cong NE/E$  is cyclic of order  $p$ . Assume that  $N \subseteq E$ . If  $|N| > p^2$ , then  $N$  has a proper subgroup  $H$  of order  $p^2$  with  $H \trianglelefteq G_p$ , a Sylow  $p$ -subgroup of  $G$ . By the hypotheses,  $H$  has semi- $\Pi$ -property in  $G$ , and so there is a subgroup  $T$  of  $G$  such that  $G = TH$  and  $H \cap T$  has  $\Pi$ -property in  $T$ . Clearly,  $G = NT$ . Thus  $N \cap T \trianglelefteq G$  since  $N$  is abelian. If  $T \neq G$ , then  $N \cap T \neq N$ . It follows that  $N \cap T = 1$  since  $N$  is minimal normal in  $G$ . Hence  $|N| = |G : T| \leq |H| = p^2$ , a contradiction. If  $T = G$ , then  $H \cap T = H$  has  $\Pi$ -property in  $T = G$ . By Lemma 2.4,  $N = H$  is of order  $p^2$ , which contradicts to  $|N| > p^2$  and thus  $|N| \leq p^2$ .

If  $|N| = p^2$ , then  $\text{Aut}(N)$  is of order  $(p^2 - 1)(p^2 - p)$ . Since  $G/C_G(N)$  is isomorphic to some subgroup of  $\text{Aut}(N)$ ,  $|G/C_G(N)|$  is a divisor of  $(p^2 - 1)(p^2 - p)$ . But  $(|G|, p^2 - 1) = 1$ , so  $|G/C_G(N)|$  is a  $p$ -number. It follows from [5, Lemma 1.7.11] that  $|G/C_G(N)| = 1$  and hence  $N \subseteq Z(G)$ . It follows that all subgroups of  $N$  are normal in  $G$ . This is not true for  $|N| = p^2$  and  $N$  is a minimal normal subgroup  $G$ . Therefore,  $|N| \neq p^2$  and so  $|N| = p$ .

(3)  $p = 2$ .

If  $p \neq 2$ , then  $G$  is of odd order since  $(|G|, p^2 - 1) = 1$ . Thus  $G$  is solvable and so  $O_p(G) \neq 1$  by (1). Then (2) implies that  $G$  has a minimal normal subgroup  $N$  of order  $p$ . By Lemma 2.1(3) and the hypotheses, every subgroup of order  $p$  in  $E/N$  has semi- $\Pi$ -property in  $G/N$ . By Theorem A,  $E/N \leq \text{SE}_p(G/N)$ . Since  $N$  is cyclic,  $E \leq \text{SE}_p(G)$ . Similar to the proof of Theorem 4.1, we have that  $G$  is  $p$ -nilpotent, contrary to the choice of  $G$ . Thus  $p = 2$  and (3) holds.

(4) Let  $N \leq E$  be a minimal normal subgroup of  $G$ , then  $N$  is of order 2 and hence is contained in  $Z(G)$ .

Assume that  $L$  is a minimal normal subgroup of  $N$ . If  $N$  is not a 2-group, then, since  $O_{p'}(G) = 1$  by (1),  $L$  is a nonabelian simple group. By [11, (10.1.9)] and  $(|G|, p^2 - 1) = 1$ , the order of a Sylow 2-subgroup of  $L$  is greater than 4. Choose  $H$  to be a subgroup of  $L$  of order 4. We claim that  $G$  is the only supplement of  $H$  in  $G$ . In fact, if  $H$  has a proper supplement  $T$  in  $G$ , then  $|G : T| = 2$  or 4. If  $|G : T| = 2$ , then  $T$  is normal in  $G$ . Since  $LT = HT = G$ ,  $|L : L \cap T| = |G : T| = 2$ . This shows that  $L \cap T \trianglelefteq L$ , a contradiction. If

$|G : T| = 4$ , then  $|L : T \cap L| = 4$ . Considering the permutation of  $L$  on the right coset of  $L \cap T$ , we can see that  $L/(L \cap T)_G$  is isomorphic to some subgroup of the symmetric group  $S_4$  of degree 4. Since  $(|G|, p^2 - 1) = 1$ ,  $L/(L \cap T)_G$  is a 2-group. But  $L$  is simple, a contradiction. Thus our claim holds and therefore,  $H$  has  $\Pi$ -property in  $G$ . Applying Lemma 2.3,  $N$  is abelian and hence is a 2-group. By Theorem A,  $N$  is cyclic and thus (4) holds.

(5)  $\text{Soc}(E) \cap \Phi(G) \neq 1$ .

If  $\text{Soc}(E) \cap \Phi(G) = 1$  then  $\text{Soc}(E)$  is complement in  $G$  and hence is complement in  $E$ . By (4),  $\text{Soc}(E) \leq Z(G)$ . If  $E = \text{Soc}(E)$ , then  $E \leq Z(G)$  and hence  $G$  is  $p$ -nilpotent since  $G/E$  is. If  $\text{Soc}(E) < E$  and let  $M$  be a complement of  $\text{Soc}(E)$  in  $E$ , then  $M \neq 1$ . Moreover, since  $\text{Soc}(E) \leq Z(G)$ ,  $M \trianglelefteq E$  and hence  $M \cap \text{Soc}(E) \neq 1$ , a contradiction. Thus (5) holds.

(6) Every cyclic subgroup of order 2 or 4 in  $E$  has semi- $\Pi$ -property in  $G$ .

It follows directly and Step (3) that every subgroup of order 4 has semi- $\Pi$ -property in  $G$ . Let  $A = \langle a \rangle$  be a subgroup of order 2. By (4) and (5),  $G$  has a minimal normal subgroup  $N \leq E \cap \Phi(G)$  and  $N = \langle b \rangle$  is of order 2. Obviously,  $N \leq Z(G)$ . If  $A = N$ , then it is clear that  $A$  has semi- $\Pi$ -property. Assume  $A \neq N$ . Then  $H = AN$  is of order 4. By hypotheses,  $H$  has semi- $\Pi$ -property in  $G$ . Suppose  $G = HT$  and  $H \cap T$  has  $\Pi$ -property in  $T$ . If  $T = G$ , then  $H$  has  $\Pi$ -property in  $G$ . It follows from Lemma 2.5 that  $A$  has  $\Pi$ -property in  $G$ . If  $T < G$ , then  $|G : T| = 2$  or 4 since  $|H| = 4$ . If  $|G : T| = 2$ , then  $T$  is maximal in  $G$  and hence  $N \leq T$ . Thereby,  $A \cap T = 1$ , otherwise  $H = AN \leq T$  and  $G = HT = T$ . Also,  $AT = ANT = G$ . Thus  $A$  has semi- $\Pi$ -property in  $G$  in this case. If  $|G : T| = 4$ , then  $N \not\leq T$  and  $T_1 = NT$  is maximal in  $G$ , and then  $T_1$  is a complement of  $A$  in  $G$  and  $A$  has semi- $\Pi$ -property in  $G$ . Thus (6) holds.

(7) The final contradiction.

By (6) and Theorem A,  $E \leq \text{SE}_p(G)$ . It follows from  $G/E$  is  $p$ -nilpotent that  $G$  is  $p$ -nilpotent. This is the final contradiction and the theorem holds.  $\square$

**Theorem 4.3.** *Let  $G$  be a group and  $p$  an odd prime divisor of  $|G|$ . Assume that  $E$  is a normal subgroup of  $G$  with  $p$ -nilpotent quotient. Suppose that  $P$  is a Sylow  $p$ -subgroup of  $E$  and  $N_G(P)$  is  $p$ -nilpotent. If every minimal subgroup of  $P$  has semi- $\Pi$ -property in  $G$ , then  $G$  is  $p$ -nilpotent.*

*Proof.* Assume that the theorem is not true and let  $G$  be a counter example of minimal order, we prove the theorem via the following steps.

(1)  $O_{p'}(G) = 1$ .

If  $O_{p'}(G) \neq 1$ , then the hypotheses still hold on  $G/O_{p'}(G)$ . Hence we can assume that  $G/O_{p'}(G)$  is  $p$ -nilpotent by the choice of  $G$ . It follows that  $G$  is  $p$ -nilpotent, a contradiction and then  $O_{p'}(G) = 1$ .

(2)  $O_p(E) \neq 1$  and  $O_p(E) = F(E) = F^*(E)$ .

Let  $N$  be a minimal normal subgroup of  $G$  contained in  $E$ . Then, by (1),  $p$  divides  $|N|$ . By the hypotheses, every subgroup of order  $p$  in  $N$  has semi- $\Pi$ -property in  $G$ . If all subgroups of order  $p$  in  $N$  are complemented in  $G$ , then

by Lemma 2.6,  $NP$  is  $p$ -nilpotent and so is  $N$ . Since  $O_{p'}(G) = 1$  by (1),  $N$  is a  $p$ -group. Assume there is a subgroup  $H$  of order  $p$  in  $N$  not complemented in  $G$ . Then  $G$  is the only supplement of  $H$  in  $G$ . Hence  $H$  must have  $\Pi$ -property in  $G$ . By Lemma 2.3,  $N$  is a  $p$ -group and so  $O_p(E) \neq 1$ .

Since  $O_{p'}(E) \leq O_{p'}(G) = 1$ , it is easy to see that  $F(E) = O_p(E)$ . If  $F(E) \neq F^*(E)$ , then we can choose a  $G$ -chief factor  $R/F(E)$  with  $R \subseteq F^*(E)$ . Let  $Q = O^p(R) = \langle a \in R \mid p \nmid |a| \rangle$  and  $O = O_p(E) \cap O^p(R)$ . Then  $Q/O \cong R/O_p(G)$  is a chief factor of  $G$  and is characteristically simple. Choose  $M/O$  to be a minimal normal subgroup of  $Q/O$ . Then  $Q/O \cong M/O \times \cdots \times M/O$ . Clearly,  $M$  is not solvable, otherwise,  $M \subseteq F(E)$ . Let  $x$  be an element of  $F^*(E)$  of order  $p'$ . Then  $x$  induces an inner automorphism on each chief factor of  $F^*(E)$  and so acts trivially on all abelian chief factors. In particular,  $x$  acts trivially on all  $G$ -chief factors of  $F(E)$ . By [4, A,12.3],  $x$  acts trivially on  $O_p(E)$ . Thus all  $p'$ -elements in  $F^*(E)$  act trivially on  $O_p(E)$ . It follows that  $Q$  and so  $O^p(M)$  act trivially on  $O_p(E)$ . Clearly,  $M$  is not  $p$ -nilpotent, so  $M$  has a subgroup  $X$ , which is not  $p$ -nilpotent, but all of its proper subgroups are  $p$ -nilpotent. Then  $X = A \rtimes B$ , where  $A$  is a  $p$ -group and  $B$  is a cyclic  $p'$ -group. Assume  $B = \langle x \rangle$ . Then  $x \in F^*(E)$  and  $x$  acts trivially on  $O_p(E)$ . If all elements of order  $p$  in  $A$  are contained in  $O_p(E)$ , then  $B$  acts trivially on  $A$  by [7, Satz IV.5.12]. This is contrary to the choice of  $X$ . Thus there must be elements of order  $p$  in  $A \setminus O_p(E)$ . Then  $\langle x \rangle$  does not avoid  $Q/O$ . If  $\langle x \rangle$  has  $\Pi$ -property in  $G$ , then, by Lemma 2.3,  $Q/O$  is a  $p$ -factor. This is not true and hence  $\langle x \rangle$  does not have  $\Pi$ -property in  $G$ . On the other hand, since  $|x| = p$ , if  $\langle x \rangle$  is not complemented in  $G$ , then  $\langle x \rangle$  is contained in every supplement of it in  $G$  and it follows that  $\langle x \rangle$  has  $\Pi$ -property in  $G$  since  $\langle x \rangle$  has semi- $\Pi$ -property in  $G$  by the hypotheses. Therefore,  $\langle x \rangle$  is complemented in  $G$  and so is in  $M$ . Choose  $T$  to be a complement of  $\langle x \rangle$  in  $M$ . Then  $|M : T| = p$ . By considering the action of  $M$  on the right coset of  $T$  in  $M$ , one can find that  $M/T_M$  is isomorphic to a subgroup of  $S_p$ , the symmetric group of degree  $p$ . Hence the Sylow  $p$ -subgroups of  $M/T_M$  are of order  $p$ . If  $T_M$  is not contained in  $O_p(E)$ , then  $M/T_M$  is a  $p$ -group since  $M/M \cap O_p(E)$  is simple. It follows that  $x \in O^p(M) \subseteq T$ , a contradiction. Thus  $T_M \subseteq O_p(E)$  and so the Sylow  $p$ -subgroups of  $M/M \cap O_p(E) = M/O$  are of order  $p$ . Since  $x \in M \setminus O_p(E)$  and  $|x| = p$ , every non trivial  $p$ -group of  $M/O$  is a conjugate of  $\langle x \rangle O/O$ , that is, for every subgroup  $\overline{H}$  of order  $p$  in  $M/O$  there is a subgroup  $H$  of order  $p$  in  $M$  such that  $\overline{H} = HO/O$ . Furthermore, by the choice of  $M$ , we see that for every subgroup  $\overline{H}$  of order  $p$  in  $Q$  there is also a subgroup  $H$  of order  $p$  in  $Q$  such that  $\overline{H} = HO/O$ .

Now, we claim that every subgroup of order  $p$  in  $Q/O$  is complemented in  $G/O$ . Choose  $\overline{H} = HO/O$  to be a subgroup of order  $p$  in  $Q/O$ , where  $H$  is a subgroup of order  $p$ . Then by above argument,  $H$  is complemented in  $G$ . Assume that  $T$  is a complement of  $H$  in  $G$ . Then  $T$  is maximal in  $G$ . Let  $Q_1$  be

a minimal supplement of  $O$  in  $Q$ . Then, by [5, Lemma 2.3.4],  $Q_1 \cap O \subseteq \Phi(Q_1)$ . So,  $Q_1$  is generated by all its  $p'$ -elements. Since, by the above argument,  $O \leq Z_\infty(Q)$ , we have  $O \leq C_Q(Q_1)$ . Hence  $Q_1 \trianglelefteq Q$ . Thus  $Q = O^p(Q) \leq Q_1$  and so  $Q = Q_1$ . It follows that  $O = O \cap Q \subseteq \Phi(Q) \subseteq \Phi(G) \subseteq T$ . Hence  $HO/O$  is complemented in  $G/O$  and  $T/O$  is a complement of it. Our claim holds.

It is easy to see that  $N_{G/O}(P/O)$  is  $p$ -nilpotent. Hence, by Lemma 2.6.  $QP/O$  is  $p$ -nilpotent and so is  $Q$ . But this is not true and so (2) holds.

(3) *The final contradiction.*

By Theorem B and Step (2), we have that  $E \leq \text{SE}(E)$ . In particular,  $E$  is supersolvable. Since  $O_{p'}(G) = 1$  by (1),  $P$ , the Sylow  $p$ -subgroup of  $E$ , is normal in  $E$  and hence is normal in  $G$ . Thus  $G = N_G(P)$  is  $p$ -nilpotent. The theorem holds.  $\square$
