# ON THE NILPOTENT MULTIPLIER OF A FREE PRODUCT 

B. MASHAYEKHY

#### Abstract

In this paper, using a result of J. Burns and G. Ellis (Math. Z. 226(1997) 405-28), we prove that the $c$-nilpotent multiplier (the Baer-invariant with respect to the variety of nilpotent groups of class at most $c, \mathcal{N}_{c}$ ) does commute with the free product of cyclic groups of mutually coprime order.

## 1. Introduction and Motivation

I. Schur [12], in 1904, using projective representation theory of groups, introduced the notion of a multiplier of a finite group. It was known later that the Schur multiplier had a relation with homology and cohomology of groups. In fact, if $G$ is a finite group, then

$$
M(G) \cong H^{2}\left(G, \mathbf{C}^{*}\right) \quad \text { and } \quad M(G) \cong H_{2}(G, \mathbf{Z})
$$

where $M(G)$ is the Schur multiplier of $G, H^{2}\left(G, \mathbf{C}^{*}\right)$ is the second cohomology of $G$ with coefficient in $\mathbf{C}^{*}$ and $H_{2}(G, \mathbf{Z})$ is the second internal homology of $G$ [see 7]. In 1942, H. Hopf [6] proved that

$$
M(G) \cong H^{2}\left(G, \mathbf{C}^{*}\right) \cong \frac{R \cap F^{\prime}}{[R, F]}
$$

where $G$ is presented as a quotient $G=F / R$ of a free group $F$ by a normal subgroup $R$ in $F$. He also proved that the above formula is independent of the presentation of $G$.

[^0]R. Baer [1], in 1945, using the variety of groups, generalized the notion of the Schur multiplier as follows.

Let $\mathcal{V}$ be a variety of groups defined by the set of laws $V$ and let $G$ be a group with a free presentation $1 \longrightarrow R \longrightarrow F \longrightarrow G \longrightarrow 1$. Then the Baer-invariant of $G$ with respect to the variety $\mathcal{V}$ is defined to be

$$
\mathcal{V} M(G):=\frac{R \cap V(F)}{\left[R V^{*} F\right]}
$$

where $V(F)$ is the verbal subgroup of $F$ with respect to $\mathcal{V}$ and

$$
\begin{gathered}
{\left[R V^{*} F\right]=<v\left(f_{1}, \ldots, f_{i-1}, f_{i} r, f_{i+1}, \ldots, f_{n}\right) v\left(f_{1}, \ldots, f_{i}, \ldots f_{n}\right)^{-1} \mid r \in R,} \\
1 \leq i \leq n, v \in V, f_{i} \in F, n \in \mathbf{N}>
\end{gathered}
$$

It is known that the Baer-invariant of a group $G$ is always abelian and independent of the choice of the presentation of $G$. (See C. R. Leedham-Green and S. McKay [8], from which our notation has been taken, and H. Neumann [10] for the notion of variety of groups.) Note that if $\mathcal{V}$ is the variety of abelian groups, $\mathcal{A}$, then the Baer-invariant of $G$ will be

$$
\mathcal{A} M(G)=\frac{R \cap F^{\prime}}{[R, F]}
$$

which is the Schur multiplier of $G, M(G)$. Also if $\mathcal{V}=\mathcal{N}_{c}$ is the variety of nilpotent groups of class at most $c \geq 1$, then the Baer-invariant of the group $G$ with respect to $\mathcal{N}_{c}$ will be

$$
\mathcal{N}_{c} M(G)=\frac{R \cap \gamma_{c+1}(F)}{\left[R,{ }_{c} F\right]}
$$

where $\gamma_{c+1}(F)$ is the $(c+1)$-st term of the lower central series of $F$ and $\left[R,{ }_{1} F\right]=[R, F], \quad\left[R,{ }_{c} F\right]=\left[\left[R,_{c-1} F\right], F\right]$. According to J. Burns and G. Ellis' paper [2] we shall call $\mathcal{N}_{c} M(G)$ the $c$-nilpotent multiplier of $G$ and denote it by $M^{(c)}(G)$. It is easy to see that 1-nilpotent multiplier is actually the Schur multiplier.

Theorem 1.1 Let $\mathcal{V}$ be a variety of groups, then $\mathcal{V} M(-)$ is a covariant functor from the category of all groups, $\mathcal{G}$ roups, to the category of all abelian groups, $\mathcal{A} b$.

Proof. See [8] page 107.

Now with regards to the above theorem, we are going to concentrate on the relation between the functors, $M^{(c)}(-), c \geq 1$, and the free product as follows.

In 1952, C. Miller [9] proved that $M(G) \cong H(G)$, where $H(G)$ is the group of all commutator relations of $G$, taken modulo universal commutator relations. He also showed that

Theorem 1.2 (C. Miller [9]) Let $G_{1}$ and $G_{2}$ be two arbitrary groups, then $H\left(G_{1} * G_{2}\right) \cong H\left(G_{1}\right) \oplus H\left(G_{2}\right)$, where $G_{1} * G_{2}$ is the free product of $G_{1}$ and $G_{2}$.

By the above theorem we can conclude the following corollary.
Corollary 1.3 The Schur multiplier functor, $M(-): \mathcal{G}$ roups $\longrightarrow \mathcal{A} b$, is coproduct-preserving. (Note that coproduct in $\mathcal{G}$ roups is free product and in $\mathcal{A} b$ is direct sum.)

In view of homology and cohomology of groups, we have the following theorem.

Theorem 1.4 Let $A$ be a $G$-module, then $H^{n}(-, A), H_{n}(-, A)$ are coproduct-preserving functors from $\mathcal{G}$ roups to $\mathcal{A}$, for $n \geq 2$, i.e

$$
\begin{aligned}
H^{n}\left(G_{1} * G_{2}, A\right) \cong H^{n}\left(G_{1}, A\right) \oplus H^{n}\left(G_{2}, A\right) & \text { for all } n \geq 2 \\
H_{n}\left(G_{1} * G_{2}, A\right) \cong H_{n}\left(G_{1}, A\right) \oplus H_{n}\left(G_{2}, A\right) & \text { for all } n \geq 2
\end{aligned}
$$

Proof. See [5, page 220]. Note that the above theorem does also confirm that the functor

$$
M(-)=H_{2}(-, \mathbf{Z})=H^{2}\left(-, \mathbf{C}^{*}\right)
$$

is coproduct-preserving.
Now, with regards to the above theorems, it seems natural to ask whether the $c$-nilpotent multiplier functors $M^{(c)}(-), c \geq 2$, are coproductpreserving or not. To answer the question, first we state an important theorem of J. Burns and G. Ellis [2, Proposition 2.13 \& Erratum at http://hamilton.ucg.ie/] which is proved by a homological method.

Theorem 1.5 (J. Burns and G. Ellis [2]) Let $G$ and $H$ be two arbitrary groups, then there is an isomorphism

$$
M^{(2)}(G * H) \cong M^{(2)}(G) \oplus M^{(2)}(H) \oplus M(G) \otimes H^{a b} \oplus M(H) \otimes G^{a b} \oplus \operatorname{Tor}\left(G^{a b}, H^{a b}\right),
$$

where $G^{a b}=G / G^{\prime}, H^{a b}=H / H^{\prime}$ and Tor $=$ Tor $_{1}^{\mathbf{Z}}$.
Now, we are ready to show that the second nilpotent multiplier functor $M^{(2)}(-)$, is not coproduct-preserving, in general.

Example 1.6 Let $D_{\infty}=<a, b \mid a^{2}=b^{2}=1>\cong \mathbf{Z}_{2} * \mathbf{Z}_{2}$ be the infinite dihedral group. Then

$$
M^{(2)}\left(D_{\infty}\right) \not \neq M^{(2)}\left(\mathbf{Z}_{2}\right) \oplus M^{(2)}\left(\mathbf{Z}_{2}\right)
$$

Proof. By Theorem 1.5 we have

$$
M^{(2)}\left(D_{\infty}\right)=M^{(2)}\left(\mathbf{Z}_{2} * \mathbf{Z}_{2}\right)
$$

$\cong M^{(2)}\left(\mathbf{Z}_{2}\right) \oplus M^{(2)}\left(\mathbf{Z}_{2}\right) \oplus \mathbf{Z}_{2} \otimes M\left(\mathbf{Z}_{2}\right) \oplus M\left(\mathbf{Z}_{2}\right) \otimes \mathbf{Z}_{2} \oplus \operatorname{Tor}\left(\mathbf{Z}_{2}, \mathbf{Z}_{2}\right)$.
Clearly $M^{(2)}\left(\mathbf{Z}_{2}\right)=0=M\left(\mathbf{Z}_{2}\right)$. Also it is well-known that $\operatorname{Tor}\left(\mathbf{Z}_{2}, \mathbf{Z}_{2}\right) \cong \mathbf{Z}_{2} \otimes \mathbf{Z}_{2} \cong \mathbf{Z}_{2}$ (see [11]).
Therefore

$$
M^{(2)}\left(\mathbf{Z}_{2} * \mathbf{Z}_{2}\right) \cong \mathbf{Z}_{2}
$$

but

$$
M^{(2)}\left(\mathbf{Z}_{2}\right) \oplus M^{(2)}\left(\mathbf{Z}_{2}\right) \cong 1
$$

Hence the result holds.
In spite of the above example, using Theorem 1.5, we can show that the second nilpotent multiplier functor, $M^{(2)}(-)$, preserves the coproduct of a finite family of cyclic groups of mutually coprime order.

Corollary 1.7 Let $\left\{C_{i} \mid 1 \leq i \leq n\right\}$ be a family of cyclic groups of mutually coprime order. Then

$$
M^{(2)}\left(\prod_{i=1}^{n}{ }^{*} C_{i}\right) \cong \oplus \sum_{i=1}^{n} M^{(2)}\left(C_{i}\right)
$$

where $\prod_{i=1}^{n}{ }^{*} C_{i}$ is the free product of $C_{i}$ 's, $1 \leq i \leq n$.
Proof. We proceed by induction on $n$. If $n=2$, then by Theorem 1.5 and using the fact that the Baer-invariant of any cyclic group is trivial, we have

$$
M^{(2)}\left(C_{1} * C_{2}\right) \cong \operatorname{Tor}\left(C_{1}, C_{2}\right)
$$

Since $C_{1}$ and $C_{2}$ are finite abelian groups with coprime order, $\operatorname{Tor}\left(C_{1}, C_{2}\right) \cong C_{1} \otimes C_{2}=1$ (see [11]).

If $n=3$, then similarly we have

$$
\begin{gathered}
M^{(2)}\left(C_{1} * C_{2} * C_{3}\right) \cong M^{(2)}\left(C_{1} * C_{2}\right) \oplus M^{(2)}\left(C_{3}\right) \oplus M^{(1)}\left(C_{1} * C_{2}\right) \otimes C_{3} \\
\oplus\left(C_{1} * C_{2}\right)^{a b} \otimes M^{(1)}\left(C_{3}\right) \oplus \operatorname{Tor}\left(\left(C_{1} * C_{2}\right)^{a b}, C_{3}\right) \\
\cong \operatorname{Tor}\left(C_{1} \oplus C_{2}, C_{3}\right) \cong\left(C_{1} \oplus C_{2}\right) \otimes C_{3} \cong\left(C_{1} \otimes C_{3}\right) \oplus\left(C_{2} \otimes C_{3}\right)=1 .
\end{gathered}
$$

Note that $M^{(2)}\left(C_{1} * C_{2}\right)=M^{(2)}\left(C_{3}\right)=M^{(1)}\left(C_{1} * C_{2}\right)=1$. By a similar procedure we can complete the induction.

## 2. The Main Result

In this section, we are going to generalize the above corollary to the variety of nilpotent groups of class at most $c, \mathcal{N}_{c}$, for all $c \geq 2$.

Notation 2.1 Let $C_{i}=<x_{i} \mid x_{i}^{r_{i}}>\cong \mathbf{Z}_{r_{i}}$ be cyclic group of order $r_{i}, 1 \leq i \leq t$ such that $\left(r_{i}, r_{j}\right)=1$ for all $i \neq j$. Put $C=\prod_{i=1}^{t}{ }^{*} C_{i}$, the free product of $C_{i}$ 's, $1 \leq i \leq t, F=\prod_{i=1}^{t}{ }^{*} F_{i}$, where $F_{i}$ is the free group on $\left\{x_{i}\right\}, 1 \leq i \leq t$, and $S=<x_{i}^{r_{i}} \mid 1 \leq i \leq t>^{F}$, the normal closure of $\left\{x_{i}^{r_{i}} \mid 1 \leq i \leq t\right\}$ in $F$. Note that $F$ is free on $\left\{x_{1}, \ldots x_{t}\right\}$. It is easy to see that the following sequence is exact:

$$
1 \longrightarrow S \xrightarrow{\subseteq} F \xrightarrow{\text { nat }} C \longrightarrow 1
$$

Define by induction $\rho_{1}(S)=S, \rho_{n+1}(S)=\left[\rho_{n}(S), F\right]$. Now by Theorems 1.2 and 1.5 , we have the following corollary.

Corollary 2.2 By the above notation and assumption, we have
(i) $S \cap \gamma_{2}(F)=\rho_{2}(S)$.
(ii) $S \cap \gamma_{3}(F)=\rho_{3}(S)$ and hence $\rho_{2}(S) \cap \gamma_{3}(F)=\rho_{3}(S)$.

Proof. (i) By Corollary 1.3 $M(C)=M\left(\prod_{i=1}^{t}{ }^{*} C_{i}\right) \cong \oplus \sum_{i=1}^{t} M\left(C_{i}\right)=$ 1. On the other hand, $M(C) \cong S \cap \gamma_{2}(F) /[S, F]$. Thus $S \cap \gamma_{2}(F) /[S, F]$ $=1$ and so $S \cap \gamma_{2}(F)=[S, F]=\rho_{2}(S)$.
(ii) By Corollary $1.7 M^{(2)}(C)=M^{(2)}\left(\prod_{i=1}^{t}{ }^{*} C_{i}\right) \cong \oplus \sum_{i=1}^{t} M^{(2)}\left(C_{i}\right)=$ 1. Also by definition $M^{(2)}(C) \cong S \cap \gamma_{3}(F) /\left[S,_{2} F\right]$, so $S \cap \gamma_{3}(F)=$ $\left[S,{ }_{2} F\right]=\rho_{3}(S)$. Moreover $\rho_{3}(S) \subseteq \rho_{2}(S) \cap \gamma_{3}(F) \subseteq S \cap \gamma_{3}(F)=\rho_{3}(S)$ and hence $\rho_{2}(S) \cap \gamma_{3}(F)=\rho_{3}(S)$.
Now we consider the following two technical lemmas.
Lemma 2.3 By the Notation $2.1 \rho_{n}(S) \cap \gamma_{n+1}(F)=\rho_{n+1}(S)$, for all $n \geq 1$.

Proof. We proceed by induction on $n$. The assertion holds for $n=$ 1,2 , by Corollary 2.2.
Now in order to avoid a lot of commutator manipulations, we prove the result for $n=3$ in the special case $t=2$. Put $x=x_{1}, y=$ $x_{2}, r=r_{1}, s=r_{2}$. So $F$ is free on $\{x, y\}$ and $S=<x^{r}, y^{s}>^{F}$.
Let $g$ be a generator of $\rho_{3}(S)$, then
$g=\left[\left(x^{r}\right)^{a_{1}}, y^{a_{2}}, x^{a_{3}}\right]$ or $\left[\left(x^{r}\right)^{a_{1}}, y^{a_{2}}, y^{a_{3}}\right]$ or $\left[\left(y^{s}\right)^{a_{1}}, x^{a_{2}}, y^{a_{3}}\right]$ or $\left[\left(y^{s}\right), x^{a_{2}}, x^{a_{3}}\right]$, where $a_{i} \in \mathbf{Z}$. Clearly modulo $\rho_{4}(S)$ we have $g \equiv\left[x^{r}, y, x\right]^{\alpha}$ or $\left[x^{r}, y, y\right]^{\alpha}$ or $\left[y^{s}, x, y\right]^{\alpha}$ or $\left[y^{s}, x, x\right]^{\alpha}$, where $\alpha \in \mathbf{Z}$. Now, let $z \in \rho_{3}(S) \cap \gamma_{4}(F)$, then $z \in \rho_{3}(S)$. By the above fact and using a collecting process similar to basic commutators (see [3]) we can obtain the following congruence modulo $\rho_{4}(S)$

$$
\begin{gathered}
z \equiv\left[y^{s}, x, y\right]^{\alpha_{1}}\left[y, x^{r}, y\right]^{\beta_{1}}\left[y^{s}, x, x\right]^{\alpha_{2}}\left[y, x^{r}, x\right]^{\beta_{2}} \\
\equiv[y, x, y]^{s \alpha_{1}+r \beta_{1}}[y, x, x]^{s \alpha_{2}+r \beta_{2}}\left(\bmod \gamma_{4}(F)\right), \text { where } \alpha_{i}, \beta_{i} \in \mathbf{Z} .
\end{gathered}
$$

Note that we consider the order on $\{x, y\}$ as $x<y$.
Since $z \in \rho_{3}(S) \cap \gamma_{4}(F)$ and $\rho_{4}(S) \subseteq \gamma_{4}(F)$, we have

$$
[y, x, y]^{s \alpha_{1}+r \beta_{1}}[y, x, x]^{s \alpha_{2}+r \beta_{2}} \in \gamma_{4}(F) .
$$

It is a well-known fact, by P. Hall [3, 4], that $\gamma_{3}(F) / \gamma_{4}(F)$ is the free abelian group on $\{[y, x, y],[y, x, x]\}$. Therefore we conclude that $s \alpha_{i}+r \beta_{i}=0$, for $i=1,2$.
By a routine commutator calculation we have

$$
\begin{gather*}
{\left[y^{s}, x, y\right]^{\alpha_{1}}\left[y, x^{r}, y\right]^{\beta_{1}} \equiv\left[\left[y^{s}, x\right]^{\alpha_{1}}\left[y, x^{r}\right]^{\beta_{1}}, y\right] \quad\left(\bmod \rho_{4}(S)\right)} \\
{\left[y^{s}, x, x\right]^{\alpha_{2}}\left[y, x^{r}, x\right]^{\beta_{2}} \equiv\left[\left[y^{s}, x\right]^{\alpha_{2}}\left[y, x^{r}\right]^{\beta_{2}}, x\right] \quad\left(\bmod \rho_{4}(S)\right) .} \tag{*}
\end{gather*}
$$

Also

$$
[y, x]^{s \alpha_{i}+r \beta_{i}} \equiv\left[y^{s}, x\right]^{\alpha_{i}}\left[y, x^{r}\right]^{\beta_{i}} \in \rho_{2}(S), \text { for } i=1,2\left(\bmod \gamma_{3}(F)\right)
$$

since $s \alpha_{i}+r \beta_{i}=0, i=1,2$, we have

$$
\left[y^{s}, x\right]^{\alpha_{i}}\left[y, x^{r}\right]^{\beta_{i}} \in \rho_{2}(S) \cap \gamma_{3}(F), \text { for } i=1,2 .
$$

By corollary 2.2 (ii) $\rho_{2}(S) \cap \gamma_{3}(F)=\rho_{3}(S)$, thus

$$
\left[y^{s}, x\right]^{\alpha_{i}}\left[y, x^{r}\right]^{\beta_{i}} \in \rho_{3}(S), \text { for } i=1,2 .
$$

Therefore by $(*)$

$$
\left[y^{s}, x, y\right]^{\alpha_{1}}\left[y, x^{r}, y\right]^{\beta_{1}} \quad, \quad\left[y^{s}, x, x\right]^{\alpha_{2}}\left[y, x^{r}, x\right]^{\beta_{2}} \in \rho_{4}(S) .
$$

Hence $z \in \rho_{4}(S)$, and then $\rho_{3}(S) \cap \gamma_{4}(F)=\rho_{4}(S)$.
Note that by a similar method we can obtain the result for $n$, using induction hypothesis.

Lemma 2.4 By the above notation and assumption, $S \cap \gamma_{n}(F)=$ $\rho_{n}(S)$, for all $n \geq 1$.

Proof. We proceed by induction on $n$. For $n=1,2$ Corollary 2.2 gives the result. Now, suppose $S \cap \gamma_{n}(F)=\rho(S)$ for a natural number $n$. We show that $S \cap \gamma_{n+1}(F)=\rho_{n+1}(S)$.
Clearly $\rho_{n+1}(S) \subseteq S \cap \gamma_{n+1}(F)$, also $S \cap \gamma_{n+1}(F) \subseteq S \cap \gamma_{n}(F)=\rho_{n}(S)$, by induction hypothesis. Therefore by Lemma 2.3

$$
\rho_{n+1}(S) \subseteq S \cap \gamma_{n+1}(F) \subseteq \rho_{n}(S) \cap \gamma_{n+1}(F)=\rho_{n+1}(S)
$$

Hence the result holds.
Now, we are ready to show that the $c$-nilpotent multiplier functors, $\mathcal{N}_{c} M(-)$, preserve the coproduct of cyclic groups of mutually coprime order, for all $c \geq 1$.

Theorem 2.5 By the above notation and assumption,

$$
M^{(c)}\left(\prod_{i=1}^{t} C_{i}\right) \cong \oplus \sum_{i=1}^{t} M^{(c)}\left(C_{i}\right)=1, \text { for all } c \geq 1 .
$$

Proof. By Lemma 2.4 and the definition of $c$-nilpotent multiplier, we have

$$
M^{(c)}\left(\prod_{i=1}^{t} C_{i}\right)=\frac{S \cap \gamma_{c+1}(F)}{\left[S,_{c} F\right]}=\frac{S \cap \gamma_{c+1}(F)}{\rho_{c+1}(S)}=1, \text { for all } c \geq 1 .
$$

On the other hand, since $C_{i}$ 's are cyclic, $M^{(c)}\left(C_{i}\right)=1$, so $\oplus \sum_{i=1}^{t} \mathcal{N}_{c} M\left(C_{i}\right)$ $=1$, for all $c \geq 1$. Hence the result holds.

Remark. In [2] it can be found some relations between the $c$-nilpotent multiplier and the $c$-isoclinism theory of P . Hall and also the notion of $c$-capable groups. Moreover, one may find in [2, page 423] a topological and also a homological interpretation of the $c$-nilpotent multiplier. Thus our result, Theorem 2.5, can be expressed and used in the above mentioned areas.
